FUTURAMA database

I will be making a database representing the Futurama world. Futurama is an animated TV show that follows a pizza delivery boy who was "accidentally" placed in a cryogenic freeze chamber right before the turn of the millennium. Upon his awakening he discovered that he has awoken in the year 3000 and that the earth has become a planet in which humans, alien, mutants and robot co-exist.

The entities I will have in my database are:

- Characters- With names, and their race, age.

- Professions - The jobs that exist within the show.

- Locations - This is consist of the decryption of the various location visited in the show, and the episode number that location first appeared in.

- Trait - The distinct skills and personality of each character.

Relationships:

- Characters to other characters - there are many relationships between each character in a one-to-many relationship.

- Characters profession - can have different jobs and within the series, in a many-to-many relationship

- Characters location - the location in which each character is each character can come from only 1 location.

- Characters trait - each character will have different traits, some trait that they share.
